

ADVANTAGE

Times-2 is the Best Rotary Storage System on the Market

Aurora Times-2 Rotary Storage Cabinets are the original and still the best on the market today. While there are a number of imitators, none perform year after year as smooth and effortlessly as the original Times-2 units. No other units are as aesthetically pleasing offering the furniture quality Gloss-Tek™ textured powder coat finish in 32 standard colors, and cabinet quality unmatched by any other rotary manufacturer.

Safety -- It's all about the base:

The base assembly is the foundation of the rotary unit. The Aurora Times-2 base unit is fully manufactured, assembled, lubricated, and sealed for the life of the unit before leaving the factory in Aurora, IL. It is equipped with either a foot pedal or a hand control which provides positive position control. No competitors offer this safety feature, which is built into every Times-2 unit. The positive position control ensures a controlled and positive stop every quarter turn. It prevents the rotational momentum that can occur with other units that are free spinning push models. Although most customers prefer the foot pedal, Times-2 offer a hand controlled release handle instead as a no-charge option.

Times-2 Base Safety Feature

Unlike competitive rotary cabinets, the Times-2 base has Positive Position Control (PPC). This safety feature provides a controlled and safe stop every quarter turn.

Aurora Times-2 rotary units use the same standard divider for both letter and legal units. In addition, there are dividers sized to accommodate extra tall or extra short media. There is a divider to hold tabloid size magazines upright as well as shorter dividers to customize your units as needed.

Aurora Times-2 rotary units feature a limited lifetime warranty. This warranty includes the base, rotor, and rotor top which are often excluded from other manufacturer's lifetime warranties.

How others compare:

Datum EZ2 shelves must be attached with 4 screws which must be removed and reinstalled as the shelves are moved. Datum also has no foot pedal, only detents every quarter of a turn. Detents produce an audible 'illusion' of stopping rotation, but each unit reacts differently depending on how an individual cabinet is loaded. Users hear a stopping "thud" but the cabinet will intermittently stop, continue rotation, or stop short of the intended stopping point. That point is different for each user.

Direct Line also requires their shelves be screwed into place, and like Datum, they must be also be removed and reinstalled whenever a shelf needs to be repositioned. Direct Line also has no foot pedal, only detents every quarter of a turn. In addition, their vinyl side filler strips are held in place using 2-sided tape.

The Mayline ARC Rotary base is shipped in pieces and must be assembled in the field, requiring precious jobsite installation time and disruption. Ball bearings must be placed by hand in cups around the base. The base stop cup and spring loaded plunger must also be installed, and then everything must be heavily greased. Not an ideal procedure to be performed at all locations. Mayline has no foot pedal. Instead they have a spring-loaded plastic plunger which aligns with notches in the rotary base every quarter turn to provide a detent. They do not have a positive stopping mechanism. Mayline also has cantilever style shelves which hang from the center posts. Center panels are only optionally available.

Whether equipped to store and secure items for school nurses, security officer's weapons, files, or anything you can imagine, Aurora Times-2 is the best rotary storage unit on the market.

Advantage: Aurora.
